It is cotton picking time, we know, but we will talk first on a more seasonable topic than cotton. "We are not mad, most noble" farmer, "but we speak forth the words of truth and soberness" when we say that bread is more necessary to our existence and comfort than cotton. We cannot eat cotton; nor can we consume in clothing the hundredth part of the crop we produce. Think of the fix a farmer would be in if he should have a hundred bales of cotton on hand, and find no market for it, while at the same time his corn crop is short, his oat crop nix, and every animal on his place is helplessly and hopelessly hungry and starving! But how is the farmer who has his barns piled with oats, his corn field groaning beneath the loads of golden maize, and his fat cows and sleek porkers anxiously | Two bushels seeds at \$1, waiting to be relieved of their wealth of fatness? Now for the application: sow small grain, and sow plenty of it. Now is the accepted time-the beginning of seed time. To day, if ye will hear, commence to look around for seed, and have ready the plows and the harness-not forgetting the cotton seed meal or the crushed seed, and a moderate store of acid phosphate, and maybe kainit or muriate. The season of 1890-91 was a good season for fall oats; but the spring season of 1891 proved, as usual, a bad one for spring oats. The fall of the year is the time to sow

oats, and September is the beginning of scarcely less liable to the same disaster, least two years in three. Even when spring oats "hit" the yield is far inferior to a successful hit of fall oats on the same land. Moreover, if the fall sown crop be winter killed it will often occur before the time for spring sowing has passed, or, at least, there will be ample time in signment" until it is too late for corn or

"in season and out of season." Experience is said to be the best guide to practice; and both experience and observation teach us that the right kind of oats. sown in the right way and in the early fall, yield far more in a term of years than spring sown. The very fact that the oat, under ordinary circumstances, is a per fectly hardy plant and yet an annual indicates the fall season as the proper

Left to themselves they spring up naturally at the fall of the leaves. In our impoverished soils it is a matter of considerable importance that any plant grown shall have a long season in which to forage the soil for its appropriate food. Oats sown in September or October enjoy a period of from seven to eight months in which to extract from an unwilling or impoverished soil the elements necessary to their development and maturity. Sown in February the foraging time is reduced to three or four months.

The right kind of seed means any one of the several sub varieties of the original Red Rust proof-say the Texas or better still the Appler oat, a variety grown with signal success at the Experiment Station the past two years. It is very probably the result of close selection from the Red Rust proof variety, and is hardy, heavier and a little earlier than the Texas strain. For an anticipated yield of twenty five to fifty bushels one and a half to two bushels per acre are sufficient, if the ground be properly prepared. There is no reason why oats should be sown on rough grassy land, and roughly scratched or tubbed in. No farmer plants corn or cotton in that way, and no good farmer will put in his oats in such slipshod style. If the ground be rough, that is covered with corn stalks, bunches of grass, etc., cut down the stalks and remove everything that cannot be turned under with a two-horse plow. After plowing with a two horse plow, then sow the oats and fertilizer and har row the surface until smooth enough for a reaper. - Southern Cultivator.

A Three Mule Farm.

There is a young farmer in this county who runs a three mule farm, who has sold this year three hundred dollars worth of farm produce in addition to the cotton he made last year. He has kept an account of the income from his products, and the above amount is correct. In his neighborhood are several other

young farmers who make their side crops pay their expenses-that is all necessaries, such as clothing for themselves and families and such articles of food as they do not produce are purchased with money by selling corn, hams, poultry, butter, eggs, dried fruit, and numerous other articles in that line.

The writer knows that these young men are adding yearly to their property. They are good citizens, industrious men, and are prospering, yet they do not do more hard work than many others who are not doing near so well. They are working on the right line.

Farming, like every other business, pays when the expenses are less than the income, and like every other business it is a failure when you reverse these con

There are few men, comparatively, in any business, who earn more than a good living, and he who can show a clear \$5, \$6.25, \$6.75 and up. profit of a few hundred dollars yearly is doing finely. Most men who clear more do it at a great risk, and of those whose not leave any Store quite so rapidly. work is speculative, more fail than suc-

In the plats of wheat on which pea Experiment Farm we have a financial are rich fertilizers and splendid stock see what we lose on fertilizers.

seed after once starting in the work before | Farmers' World. plowing in the crop, because it is best not to sour the land by plowing in the vines green. Hence sow early enough to mature before ground is needed and pick off pods enough for seed.

Perhaps a fair estimate on this will be found in the following: Man and team plowing 1 day on 1 acre, \$2 00 " harrowing 1/2

Total cost of pea vine crop, Increased yield of wheat on plats ten bushels per acre, at \$1 per bushel, gives \$10, or a net income of \$5 per acre, where the extra handling can be next to nothing

We have said nothing of the increase in fertility or value of straw, which is well worth considering .- F. E. Emery, Agriculturist, N. C. Experiment Station.

Recent Facts About Ramie.

The statisticians of the Department of Agriculture say: "The situation in this fall. What if the crop be killed by severe | country regarding ramie has changed freezing one year in three? A farmer slightly in the past six months, and some can better afford to sow oats in September statements in regard to the interest in or October even if he does lose one crop | culture and the recent progress in relation in three by killing, than to rely on Jan- to decorticators are presented. While uary and February sowings, which are but little more than an interest in the subject of culture may be noted in the and in addition, are ruined by drouth at Gulf States, in California considerable areas are being planted, a bounty bill having just passed the Legislature. Two new decorticators will doubtless be ready for official trial in the South during the summer. Improvements on one of the leading French machines are noted, with an illustration of the machine. One of which to plant the land in corn, cotton, these will suffice for fifteen acres. The or other crop; while the drouth-blasted | department has just received an important spring sown oat may not "make an as- official communication from Hankow, China, with interesting facts bearing upon the methods of preparing the fibre . We are aware that we are writing on a in China, and statements regarding availtrite subject, and that we may not be ble supply for export. This is claimed able to advance any new arguments; but not to exceed 10,000 tons of all kinds. we believe it a duty to exhort on this line Samples of six kinds of commercial Chinese fibre were also forwarded.

Value of Good Water.

The importance of pure water for stock will readily appear when we consider that this element constitutes about 70 per Do not go North to buy-the times will not cent. of the entire animal, and not less than 87 per cent of milk. It is plain that if 70 per cent. of an animal's body is impure water, filled with germs of disease and inorganic vileness, that neither the flesh nor the milk can be wholesome food for man. Just how much of our preva lent liver and kidney disorders, dyspepsias, malignant fevers, dysenteries, infectious diseases and the numerous and fatal diseases of children are attributable to this cause cannot be accurately known. Analogical reasoning and the deductions of plain common-sense, however, impress us that many of our physical ills originate in the filthy mud-holes from which our stock obtain their drinking water .- Texas Farm and Ranch.
